

Internet Engineering

JS & AJAX & JSON & jQuery

مهندسی اینترنت

Dr. Yaeghoobi

Ph.D. (Computer Science and Engineering), India

Content

- JavaScript
- Prototype-based Programming
- XMLHttpRequest
- Document Object Model (DOM)
- Extensible Markup Language (XML)
- AJAX
- JSON
- jQuery

The background features a light gray diagonal band running from the top-left towards the bottom-right. A thin, dark blue line runs parallel to the bottom-left edge, and a thin, yellow line runs parallel to the bottom-right edge.

JavaScript

JavaScript (JS)

- An **object-based scripting programming** language based on the **concept of prototypes** (پیش الگو).
- **JS** is a high-level, interpreted scripting language
- Best known for its use in **websites**.
- As a multi-paradigm language, JavaScript supports **event-driven, functional, and imperative** (including **object-oriented** and **prototype-based**) programming styles. رویداد محور ، کاربردی و ضروری

JavaScript (JS) ...

- It has **APIs** for working with **text, arrays, dates, regular expressions**, and the **DOM**,
- But the language itself does **not include any I/O**, such as **networking, storage, or graphics** facilities.
 - It relies upon the **host environment** in which it is embedded to provide these features.

JavaScript (JS) ...

- JavaScript engines embedded in a web browser allow JavaScript to **connect to both the server side and the client side of web applications.**
- **Connections are made through DOM interfaces.**
- One major use of web-based JavaScript is to **write functions that are embedded in HTML pages.**
- Functions interact with the DOM of the page to perform tasks not possible in static HTML alone, such as:
 - opening a new window
 - checking input values
 - changing images as the mouse cursor moves over
 - etc.

JavaScript ...

- JavaScript is the programming language of HTML and the Web.

`getElementById()`

This example uses the method to "find" an HTML element (with `id="demo"`) and changes the element content (`innerHTML`) to "Hello JavaScript":

```
document.getElementById("demo").style.fontSize = "35px";
```

Example

Changing the style of an HTML element, is a variant of changing an HTML attribute

What Can JavaScript Do?

JavaScript can change the style of an HTML element.

Click Me!

What Can JavaScript Do?

JavaScript can change the style of an HTML element.

Click Me!

```
<!DOCTYPE html>
```

```
<html>
```

```
<body>
```

```
<h2>What Can JavaScript Do?</h2>
```

```
<p id="demo"> JavaScript can change the style of an HTML element. </p>
```

```
<button type="button"  
onclick="document.getElementById('demo').style.fontSize='35px'"> Click  
Me!</button>
```

```
</body>
```

```
</html>
```

Prototype-based Programming

Prototype-based Programming

- A **style and subset** of object-oriented programming in which:
 - **classes are *not present***
 - **behavior reuse** (known as inheritance in class-based languages) is done by *cloning* existing objects which serve as prototypes for the new ones
 - also known as *class-less*, *prototype-oriented*, or *instance-based* programming.
- Prototype-based languages have only *objects*.
- A prototype system starts with **at least one atomic object** loaded.
- **New objects** contain a **pointer** to the object that created them.
- **Additional data can be added to any object at any point at runtime.**

XMLHttpRequest

XMLHttpRequest

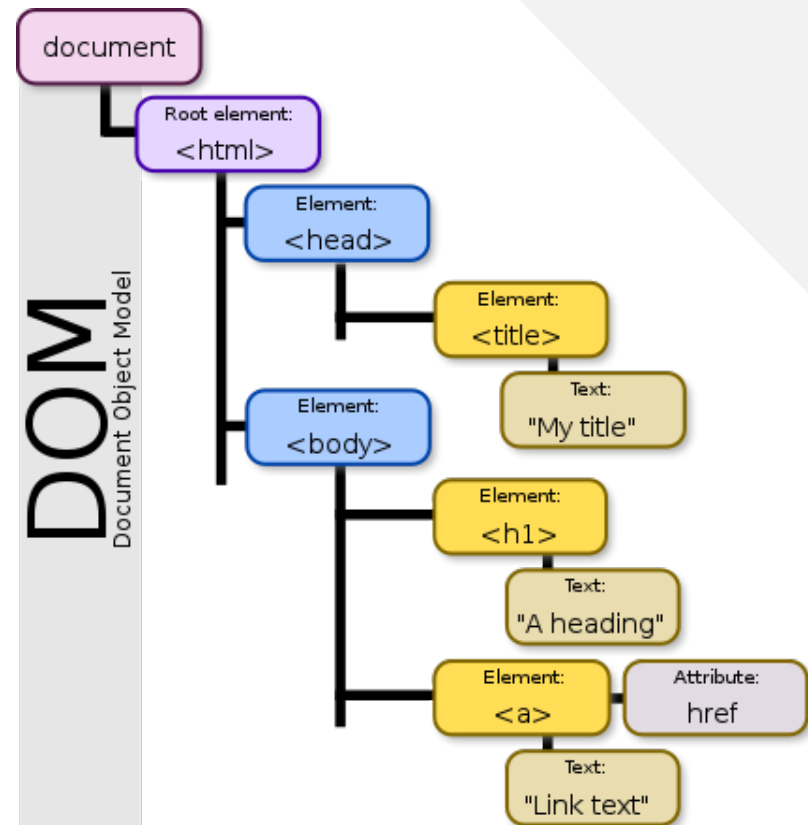

- **XMLHTTP** is a set of APIs that can be used to **transfer and manipulate XML data** to and from a **web server using HTTP**.
- Used to establish an **independent connection** channel between **Client-Side** and **Server-Side**.
- Used by:
 - JavaScript
 - Jscript
 - VBScript
 - other web browser **scripting languages**.

Document Object Model (DOM)

Document Object Model (DOM)

- DOM is a **language-independent interface** that treats an XML or HTML document as a **tree structure** wherein **each node is an object** representing a part of the document.
- DOM methods allow programmatic access to the tree; with them one **can change the structure, style or content of a document**.
- Once an **event is triggered**, the event handlers get executed.

Extensible Markup Language (XML)

Extensible Markup Language (XML)

- XML is a markup language that defines a **set of rules** for **encoding documents** in a format that is both **human-readable** and **machine-readable**.
- Although the design of XML focuses on **documents**, the language is widely used for the representation of arbitrary **data structures**, such as those used in **web services**.

```
<?xml version="1.0"?>
<quiz>
  <qanda seq="1">
    <question>
      Who was the forty-second
      president of the U.S.A.?
    </question>
    <answer>
      William Jefferson Clinton
    </answer>
  </qanda>
  <!-- Note: We need to add
  more questions later.-->
</quiz>
```

XML

The word "AJAX" is centered in a dark blue, bold, serif font. The background is white with a large, light gray diagonal band running from the top-left to the bottom-right. A thin blue line runs parallel to the bottom-left edge of the gray band, and a thin yellow line runs parallel to the bottom-right edge of the gray band.

AJAX

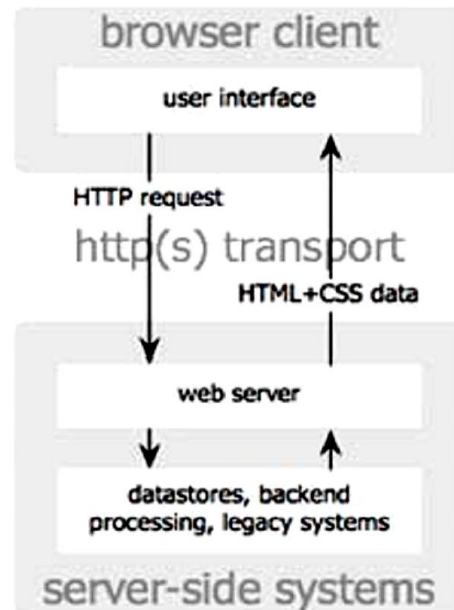

AJAX

- **AJAX** stands for **Asynchronous JavaScript And XML**.
- It is a group of web development programs used to design websites.
- The programs create interactive web applications using a combination of:
 - **Standards-based presentation: XHTML and CSS**
 - **Dynamic display and interaction: DOM**
 - **Data interchange and manipulation: XML and XSLT**
 - **Asynchronous data retrieval: XMLHttpRequest**
 - **Binding everything together: JavaScript**

AJAX ...

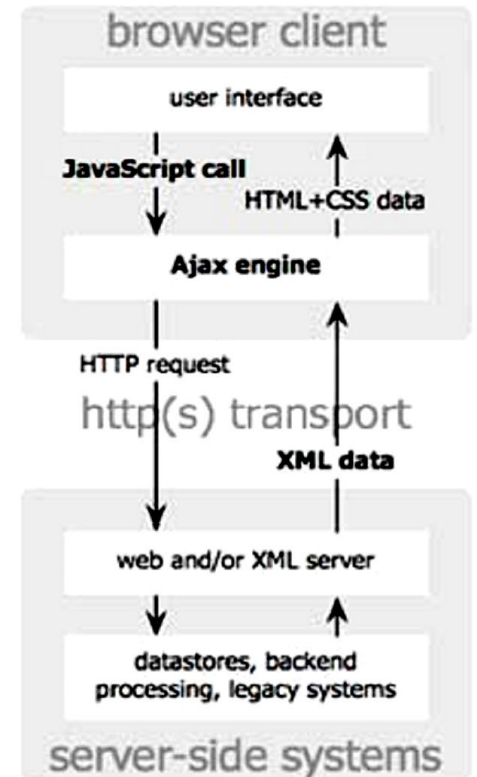

- AJAX enables web pages to **send** data to and **receive** data from a **server without changing or hindering the web page itself**.
- It allows for **asynchronous communication**.
 - **Instead of freezing up** until the completeness, the browser can **communicate with server and continue as normal**.

Traditional model vs. AJAX model

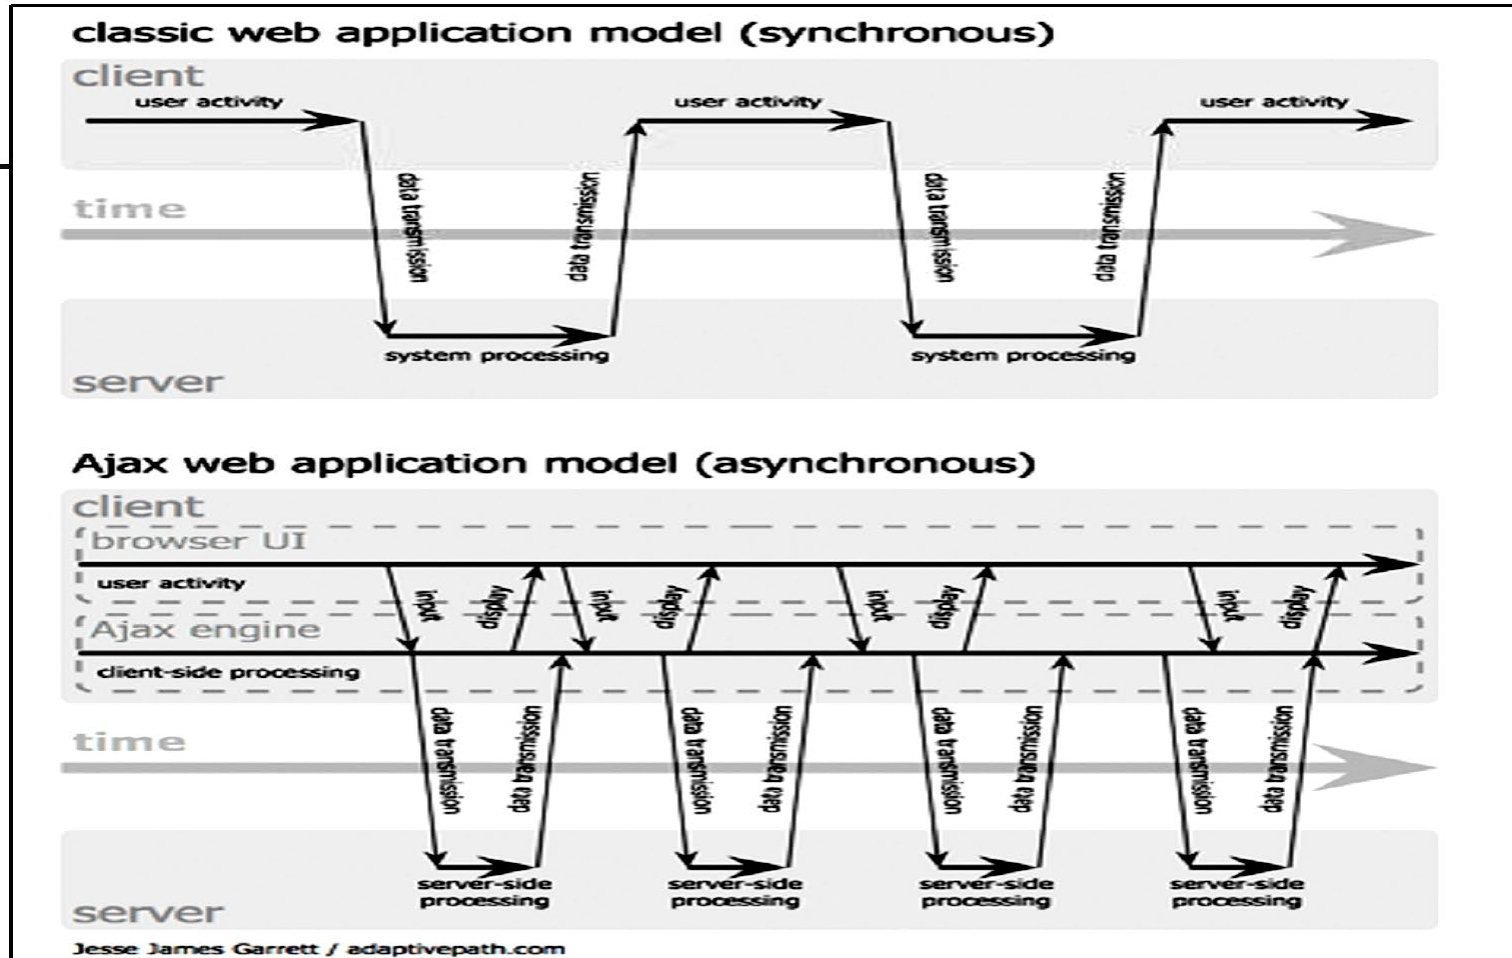

**classic
web application model**

Jesse James Garrett / adaptivepath.com

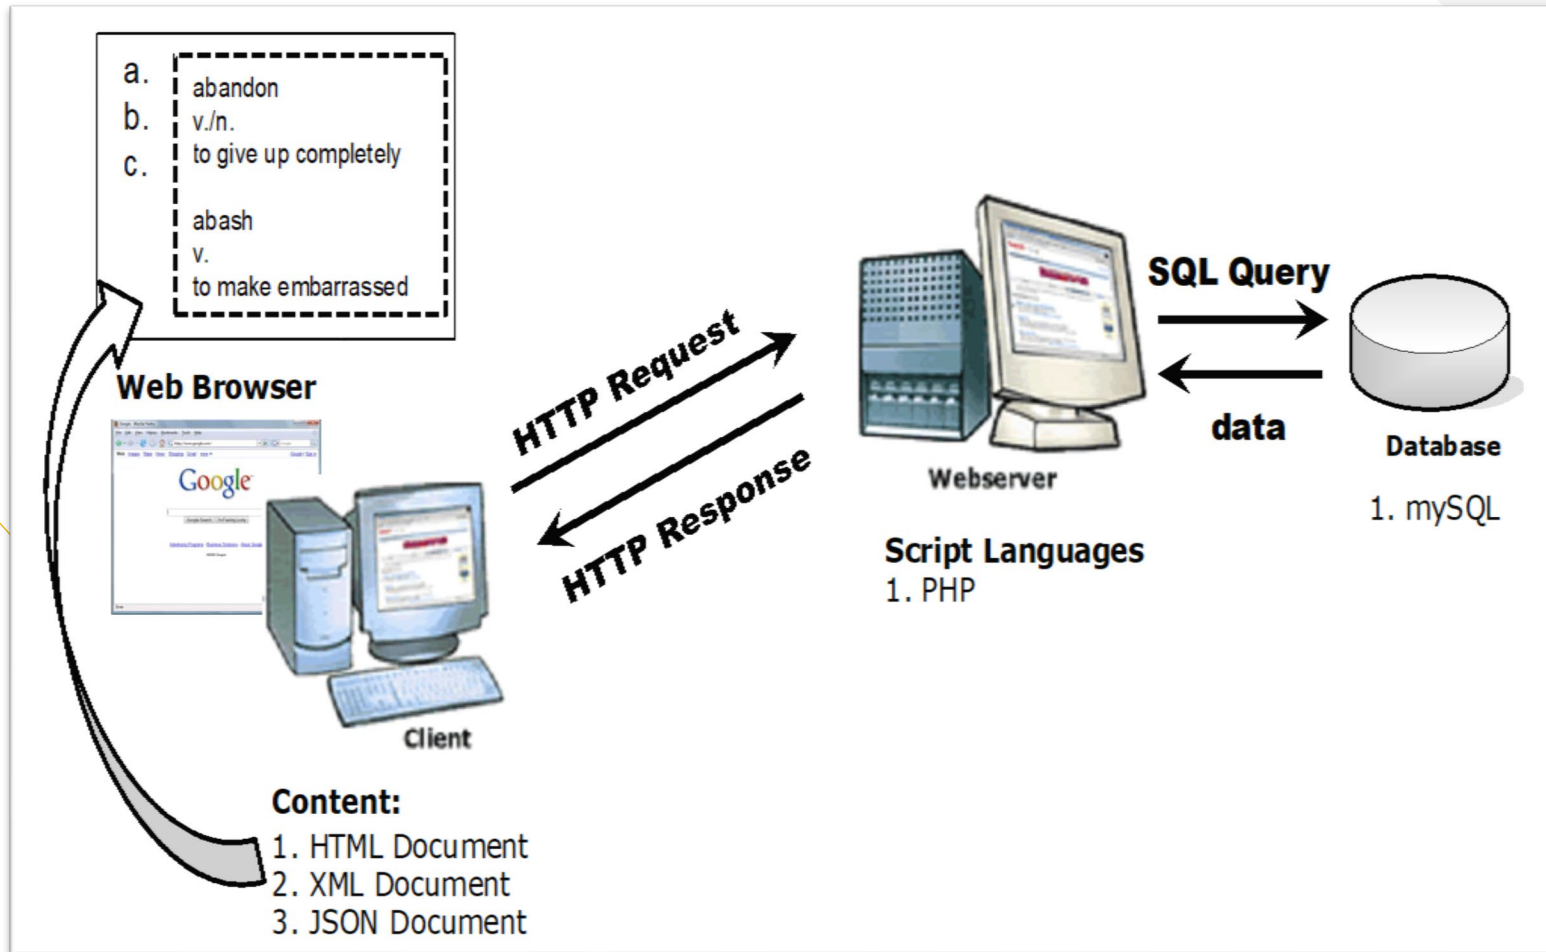

**Ajax
web application model**

Synchronous interaction vs. Asynchronous interaction

Process of AJAX call

Basic Ajax Process

- **JavaScript**

- Design an object for sending HTTP requests
- Initiate request
 - Get request object
 - Supply as onreadystatechange attribute of request
 - Initiate a GET or POST request to a JSP page
 - Get the address from a variable instead of hardcoding it
 - Send data
- Handle response
 - Wait for readyState of 4 and HTTP status of 200
 - Do something with result

- **HTML**

- Load JavaScript
- Designate control that initiates request
- Give ids to input elements and to output placeholder design

```

<html>
<head>
<link rel="stylesheet" href="example1.css" type="text/css"/>
<script type="text/javascript">

    var ajax;

    function ajaxCreate(){
        if(window.XMLHttpRequest){
            //For IE7+, Firefox, Chrome, Opera, Safari
            return new XMLHttpRequest();
        } else {
            //For IE6, IE5
            return new ActiveXObject("Microsoft.XMLHTTP");
        }
    }

    function receiveData(){
        if(ajax.readyState == 4){
            if(ajax.status == 200){
                var content = document.getElementById('content');
                content.innerHTML = ajax.responseText;
            }else{
                alert("Server process error");
            }
        }
    }
}

```

```

function sendRequest(url){
    ajax = ajaxCreate();

    if(!ajax){
        alert("Browser is not compatable with XMLHttpRequest");
        return 0;
    }

    ajax.onreadystatechange = receiveData;
    ajax.open("GET", url, true);
    ajax.send(null);
}

</script>
</head>

<body>
    <div class="letters">
        <div class="letter" id="letter-a">
            <h3>
                <a href="javascript:sendRequest('example1.php')">A</a>
            </h3>
        </div>
    </div>
    <div id="content"></div>
</body>
</html>

```

POST and GET calls in AJAX

- GET places **arguments in the query string**, but POST doesn't.
- No noticeable difference in AJAX - AJAX request does not appear in the address bar.
- GET call in AJAX still has the size limitation on the amount of data that can be passed.
- General principle:
 - **GET method:** it is used to retrieve data to display in the page and the data is not expected to be changed on the server.
 - **POST method:** it is used to update information on the server.

AJAX ...

- Google is the biggest known supporter of AJAX and has invested millions of dollars to advance it.
- Major Google products, such as Orkut, Gmail, Google Suggest, and Google Maps are AJAX applications.
- Amazon has also launched it's own search engine, A9, on AJAX.

AJAX Applications

- **Real-Time Form Data Validation**

- Form data such as user IDs, serial numbers, postal codes, or even special coupon codes that require server-side validation can be validated in a form before the user submits a form.

- **Autocompletion**

- A specific portion of form data such as an email address, name, or city name may be autocompleted as the user types.

- **Master Details Operations**

- Based on a client event, an HTML page can fetch more detailed information on data such as a product listing that enables the client to view the individual product information without refreshing the page.

- **Sophisticated User Interface Controls**

- Controls such as tree controls, menus, and progress bars may be provided that do not require page refreshes.

- **Refreshing Data on the Page**

- HTML pages may poll data from a server for up-to-date data such as scores, stock quotes, weather, or application-specific data.

- **Server-side Notifications**

- An HTML page may simulate a server-side push by polling the server for event notifications that may notify the client with a message, refresh page data, or redirect the client to another page.

AJAX Drawbacks

- Complexity
- Standardization of the XMLHttpRequest Object
- JavaScript Technology Implementations
- Debugging
- Viewable Source

The background features a light gray diagonal band running from the top-left towards the bottom-right. A thin dark blue line runs parallel to the top-left edge of this band, and a thin yellow line runs parallel to the bottom-right edge. The word "JSON" is centered in a dark blue serif font.

JSON

Text

- Text is a data transmission format on the Internet
- A need to transmit complicated (structured) data
 - Book info, movie info, etc
- Idea:
 - Encode data
 - Transmit in text format
 - Decode data

JSON

- JSON is short for **JavaScript Object Notation**.
- Basically, it is a way to **store information** in an organized and easy-to-access manner.
- JSON is built on two structures:
 - **Object:** A collection of name and value pairs
 - **Array:** An ordered list of values

JSON ...

- JSON is **derived** from the **JavaScript** scripting language for **representing simple data structures** and **associative arrays**, called **Objects**.
- However, as compared to JavaScript, it is **language-independent**, with parsers available for many languages.
- The JSON filename extension is **.json**.

JSON ...

- The JSON format is quite similar to XML and works as an alternative for the latter.
- It is primarily used to **transmit data between a server and web application**.
- It is often used for **serializing and transmitting structured data** over a network connection.

Explanation	Examples
object with one member	<pre>{ "course-name": "6.470" }</pre>
object with two members (separated by a comma)	<pre>{ "course-name": "6.470", "units": 6 }</pre>
array with 3 elements	<pre>["foo", "bar", 12345]</pre>
object with an array as a value	<pre>{ "course-name": "6.470", "times": ["12-4", "12-4", "12-4"] }</pre>
objects with objects and arrays	<pre>{ "John": { "label": "John", "data": [[1880, 0.081536], [1881, 0.08098], [1882, 0.078308]] }, "James": { "label": "James", "data": [[1880, 0.050053], [1881, 0.05025], [1882, 0.048278]] } }</pre>

Diagrams of the syntax of JSON

```
{  
  "course-name" : "6.470"  
}
```

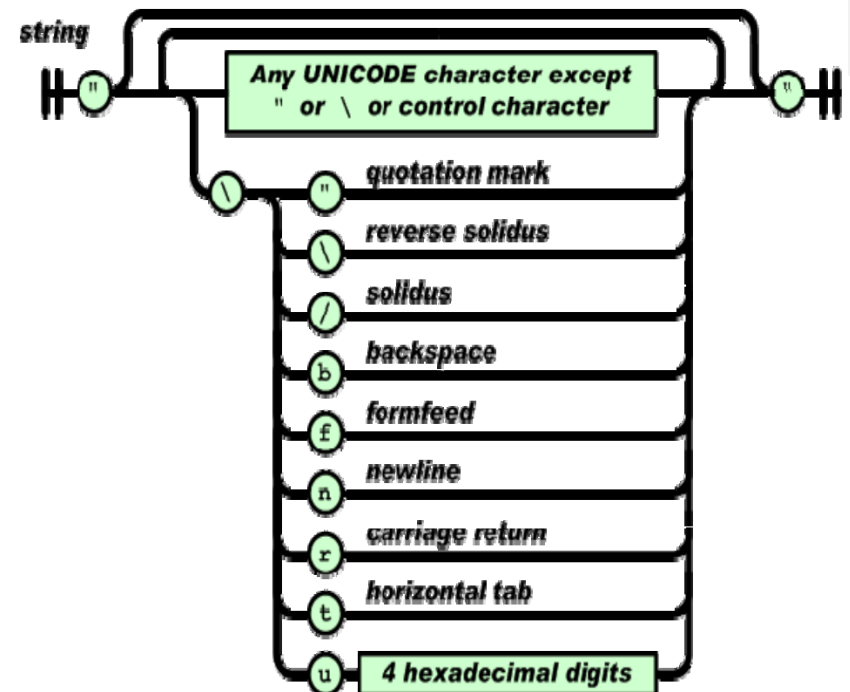

```
["foo", "bar", 12345]
```

```
{  
  "course-name" : "6.470",  
  "times": ["12-4", "12-4", "12-4"]  
}
```

Diagrams of the syntax of JSON ...

```
"data":[[1880,0.081536],[1881,0.08098],[1882,0.078308]]
```

JSON easier to be evaluated

```
}  
}
```

8]]

- To get the value 1880 marked with red color:

We can use **a.John.data[0][0]**

AJAX Vs JSON

Different Between AJAX and JSON

- The main difference between AJAX and JSON is that **AJAX is a set of various technologies**, which are used to **launch asynchronous HTTP requests** to a server using various data formats, such as JavaScript, XML, HTML, plain text or even JSON.
- **JSON is a format** which can be **used by AJAX for data exchange**. It is a way of **encoding** that can be efficiently parsed by almost all programming languages.
- In AJAX, JSON can be used to **pass raw data to or from a server-side component**.

The image features the jQuery logo, which consists of the word "jQuery" in a dark blue, serif font. The background is white with a large, light gray diagonal stripe running from the top left to the bottom right. There are also two thin diagonal lines: a dark blue one in the bottom left and a yellow one in the bottom right.

jQuery

jQuery

- jQuery is a **fast and concise JavaScript Library** that simplifies HTML document traversing, event handling, animating, and Ajax interactions for **rapid web development**.
- JavaScript libraries and frameworks:
 - Prototype, jQuery, Dojo, Echo, GWT, MooTools, Rico, YUI, etc.

jQuery Advantages

- Providing common utilities
- Handling cross-platform issues
- (Might) provide extendibility - plugins
- Faster Web development

jQuery Idea

- Putting together a set of functions
- Navigate a document Event handling
- Select DOM elements
- Create animations
- Ajax development
- Extendibility: plugins

jQuery Usage

- **Step 1:** Download the latest jQuery from jquery.com
- **Step 2:** Link the downloaded .js file

<script type="text/javascript" src="jquery-1.3.2.js">

</script>

It adds jQuery() function in the global namespace

The function is also aliased as \$().

- **Step 3:** Write your code

...

```
<script type="text/javascript">
$(document).ready(function() {
    $('#large').bind('click', function() {
        $('p').removeClass().addClass('large');
    });
    $('#medium').bind('click', function() {
        $('p').removeClass().addClass('medium');
    });
    $('#small').bind('click', function() {
        $('p').removeClass().addClass('small');
    });
    // Set default font size as medium
    $('#medium').trigger('click');
});
</script>
```

...

A SCANDAL IN BOHEMIA

I.

To Sherlock Holmes she is always THE woman. I have seldom heard him mention her under any other name. In his eyes she eclipses and predominates the whole of her sex. It was not that he felt any emotion akin to love for Irene Adler. All emotions, and that one particularly, were abhorrent to his cold, precise but admirably balanced mind. He was, I take it, the most perfect reasoning and observing machine that the world has seen, but as a lover he would have placed himself in a false position. He never spoke of the softer passions, save with a gibe and a sneer....

II.

At three o'clock precisely I was at Baker Street, but Holmes had not yet returned. The landlady informed me that he had left the house shortly after eight o'clock in the morning. I sat down beside the fire, however, with the intention of awaiting him, however long he might be. I was already deeply interested in his inquiry, for, though it was surrounded by none of the grim and strange features which were associated with the two crimes which I have already recorded, still the nature of the case and the exalted station of his client gave it a character

A SCANDAL IN BOHEMIA

I.

To Sherlock Holmes she is always THE woman. I have seldom heard him mention her under any other name. In his eyes she eclipses and predominates the whole of her sex. It was not that he felt any emotion akin to love for Irene Adler. All emotions, and that one particularly, were abhorrent to his cold, precise but admirably balanced mind. He was, I take it, the most perfect reasoning and observing machine that the world has seen, but as a lover he would have placed himself in a false position. He never spoke of the softer passions, save with a gibe and a sneer....

I was already deeply interested in his inquiry, for, though it was surrounded by none of the grim and strange features which were associated with the two crimes which I have already recorded, still, the nature of the case and the exalted station of his client gave it a character of its own....

Example

- Ajax Request:
 - `$.ajax(options)` => options: a set of key/value pairs
 - `$.get(url, [data], [callback], [type])`
 - `$.post(url, [data], [callback], [type])`
 - `$.getJSON(url, [data], [callback], [type])`
 - `$.getScript(url, [callback])`

The background features a light gray diagonal band running from the top-left to the bottom-right. There are also thin, dark blue and yellow diagonal lines in the corners.

Thanks for your Attention.
